

Silver Plating

Silver plating services for parts or components made of virtually all metallic substrates, including steel, aluminum, and copper, are offered at our job shop. Silver plating services are performed with rack line and barrel line equipment in a separate area outfitted with an independent air system. This ensures the controlled environment required for the plating process.

With strict adherence to ASTM B 700 specifications, we ensure that your parts are silver-plated with finishes of your choice - matte, semi-bright, and fully bright. The purity of the silver that we plate ranges from 99.0% to as high as 99.9%.

We can also provide other additional services, such as heat treatment, masking, and plugging for your plated parts. The electronics, medical, electrical, and aerospace industries utilize our silver plating services, especially for the highly conductive nature of silver plating we offer. In addition, silver, with its resistance to oxidization, makes it an ideal choice for applications where corrosion protection is crucial.
